The pump stores and releases the right amount of medicine through the catheter. Before you get ITB, you will meet with a treatment team that may include a doctor who specializes in rehabilitation a physiatrist or neurologist , a physical therapist, an occupational therapist, a nurse, and a social worker. A surgeon puts the device -- a round metal disc, about 1 inch thick and 3 inches around -- under the skin of your belly near your waistline. Doctors use a pump system to deliver baclofen directly into the spinal fluid. Spasticity happens when these signals become uneven, usually because the nerves have been damaged. Side effects may include: A tiny motor moves the medication from the pump through the catheter. If the pump stops working this is rare , it may give you too much medicine at once. If the catheter stops working well, you may need surgery to replace it. A doctor can give you a drug called physostigmine to counteract baclofen. You need only tiny doses for the drug to work. Your doctor will inject baclofen into your spine with a small needle. Then the team checks how well it works over 2 to 4 hours. If your muscles don't relax during the first try, you may get a larger dose to see if that makes a difference. A bad reaction to anesthesia Infection Bleeding Trouble with bladder control Pump malfunction: That can cause symptoms such as drowsiness, dizziness, weakness, trouble sleeping , lightheadedness, nausea, constipation , vomiting , loose muscles, trouble with vision , coma , respiratory depression , seizures , dry mouth , double vision , poor concentration, or diarrhea. It can help you move your muscles more normally. Your treatment team can use a small computer outside your body to send messages to the pump and make adjustments in the dose, rate, and timing of the medication. Baclofen works by restoring the normal signals. This type of treatment, called intrathecal baclofen ITB , can help people who have a hard time with side effects of the pill form.
