Unlike benzodiazepines, which may aggravate anger and hostility in some patients, especially older patients, buspirone may help patients with anxiety who also have a history of aggression. Certain drugs may inhibit the enzyme system in the liver that breaks down buspirone. In some cases, four to six weeks of treatment may be required. Any use of this site constitutes your agreement to the Terms and Conditions and Privacy Policy linked below. Side effects The most common side effects associated with buspirone involve the nervous system. Buspirone also diminishes anger and hostility for most people. Although buspirone is considered non-sedating, some patients will experience drowsiness and lack of mental alertness at higher doses and especially early in therapy. Buspirone is less sedating causes less drowsiness and mental sluggishness than other anti-anxiety drugs. Most patients will respond to a dose of 15 to 30 mg daily. Patients with severe kidney disease should not take buspirone. This total amount is divided into two or three doses during the day. Mayo Clinic Marketplace Check out these best-sellers and special offers on books and newsletters from Mayo Clinic. Buspirone's actions are different from a common class of sedatives called benzodiazepines. Unlike benzodiazepines, buspirone has no anticonvulsant or muscle-relaxant properties, and unlike benzodiazepines or barbiturates, it does not have strong sedative properties. However, buspirone usually is not used for anxiety or tension caused by the stress of everyday life. When patients are receiving certain other drugs see below in addition to buspirone, starting doses of buspirone may need to be lowered for example, 2. Mayo Clinic does not endorse companies or products. It is not known exactly how buspirone works to relieve the symptoms of anxiety. Because of this, buspirone should never be taken in combination with MAO inhibitors. What is Buspar used for? Helps you relax.
