Trials could also include non-pharmacological interventions, as long as both drug and placebo groups had the same exposure to them. The purpose of this review. We included RCTs that compared a drug with placebo, and that had the primary aim of improving sleep in people with dementia who had an identified sleep disturbance at baseline. To assess the effects, including common adverse effects, of any drug treatment versus placebo for sleep disorders in people with dementia, through identification and analysis of all relevant randomised controlled trials RCTs. Systematic assessment of adverse effects is essential. From the studies we identified for this review, we found no evidence that melatonin up to 10mg helped sleep problems in patients with moderate to severe dementia due to AD. These behaviours cause a lot of stress to carers, and may be associated with earlier admission to institutional care for people with dementia. These can include a reduction in the time spent asleep at night, frequent waking after falling asleep, wandering at night, waking early, and sleeping excessively during the day. Limited information was available for the ramelteon trial, and it came from the trial's sponsor. The purpose of this review In this updated Cochrane review, we tried to identify the benefits and common harms of any medicine used to treat sleep problems in people with dementia. The synopsis reported few significant differences from placebo for any sleep, behavioural, or cognitive outcomes; none were likely to be of clinical significance. No serious adverse effects of melatonin were reported in the included studies. Overall, the evidence was of low quality, meaning that further research is very likely to affect the results. In one study of melatonin, drug treatment was combined with morning bright light therapy. Although we searched for them, we were unable to find any trials of other sleeping medications that are commonly prescribed to people with dementia. All of the participants had dementia due to Alzheimer's disease, although sleep problems are also common in other forms of dementia. All primary sleep outcomes were measured using actigraphy.
