After the Neoral formulation became available, the potential for confusion regarding its use versus Sandimmune became apparent. The pharmacist should check for specific instructions from the prescribing physician regarding substitution so that the intended product is dispensed. Actions for Pharmacists Regarding immunosuppressive drugs and the use of generic immunosuppressants, experts convened by the American Society of Transplantation recently recommended that patient welfare be the foremost concern in prescribing or dispensing decisions. If a pharmacist discovers that an inappropriate substitution already has occurred, he or she must contact the prescribing physician so that appropriate measures, such as timely therapeutic drug monitoring, can be taken to avert untoward effects. Conclusion As immunosuppressive therapy is a lifelong undertaking, generic medications can offer considerable economic benefit to the transplant recipient. Inappropriate substitution, however, of nonbioequivalent drugs at the pharmacy level? This switch could have serious consequences because decreased bioavailability of cyclosporine is associated with an increased risk for acute rejection? This material is provided for educational purposes only and is not intended for medical advice, diagnosis or treatment. Inappropriate substitutions can place a patient at risk. Finally, within the pharmacy itself, the pharmacist also may be instrumental in averting problems by ensuring that nonbioequivalent formulations are shelved separately and are clearly differentiated by identifying labels.
